\*Offer limited to first time buyers

Management of *WirelessHART* networks and Power Modules has never been easier after the introduction of the Plantweb Insight Network Management and Power Module Management applications.

The Network Management software application provides a real-time view into the health of *WirelessHART* networks and Gateways. The intuitive interface allows visualization of the mesh network along with adherence to best practices and troubleshooting considerations.

Meanwhile, the Power Module Management application allows users to prioritize maintenance before Power Modules reach critical condition. This reduces any lapses in important data and eliminates any data mapping required.
